AB- <NV> NOVELTY - A storage memory stores the processed data which is
transmitted in a secure environment between various remote locations,
using encryption and decryption software. A broker representative
software is installed to respective computers which creates trade
record and performs reviewing, approving and disapproving of the trade
record. A trade audit security measure is provided, such that only
authorized user accesses and uses the trade data.|
AB- <BASIC> DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for
the following:
 (a) Broker transaction data processing and management method;
 (b) Broker transaction data processing and monitoring method
 USE - For managing broker transaction information such as client
profiles, stock broker transactions, etc., used by broker/dealer
representatives, local brokerage offices and government regulators.
 ADVANTAGE - Prevents unauthorized trade activities by allowing
secure input, data transfer and storage of a wide array of information,
thus eliminating the need for paper logs. Enables efficient and
comprehensive inspections by creation of standard reports which are
instantaneously accessed. Handles electronic mail communication
involving broker transactions and provides simple and low cost, less
time consuming processing of data between remote locations. Ensures
additional security features by providing trade audit functions which
prevents unauthorized trade record change.
 DESCRIPTION OF DRAWING(S) - The figure shows the flow diagram
illustrating process of recording trade information in the main server
database.

 AB- <PN> WO 200223443 A1|
 AB- <NV> NOVELTY - The reduced risk construction or trade loans from lender
 to applicant are processed by transferring ownership of trade loan
 applicant's lien rights to lender by creating an assignment of lien
 rights and power of attorney document. Activity related to loans is
 monitored by an appropriate formula applied to each loan. Construction
 loans are disbursed at times corresponding to stages of completion of
 construction project.|
 AB- <BASIC> DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included
 for computer readable medium with program for generating and processing
 reduced risk construction loans and trade loans from lender to loan
 applicant.
 USE - For reducing risk of loss associated with sanction of
 construction loan from lender to property owner applicant for
 construction project and trade loans from lender to general contractor,
 sub-contractor and material supplier applicants.
 ADVANTAGE - The method provides the lender with a character,
 financial, legal, property and project risk assessment for the
 prospective borrower in accordance with that lender's specific
 underwriting standard. The method provides the lender with on-line or
 other loan and project documentation that is standardized and
 acceptable to the lender and daily on-line funds disbursement and
 payment receipt information for any particular borrower and/or project,
 and daily on-line documentation that serves to perfect the lender's
 collateral in the event of a default. Since ownership of the loan
 applicant's lien rights are transferred to the lender, the lender is
 provided with sufficient assurance that he could recover all of his
 outstanding principal, interest, fees in the event of a default. Hence
 the lender is more inclined to provide working capital to the
 contractor/sub-contractor/material supplier.

AB- <NV> NOVELTY - Several hierarchical tiers are defined based on the
amount of total assets held in an account group to which several
individual accounts are linked and the amount of total assets is
determined for assigning an initial set of attribute parameters to the
account group. The account **transaction** and brokerage **trades**
specified by attribute parameter are **monitored** on a periodic basis
for assigning updated attribute parameters to the group. |
AB- <BASIC> DETAILED DESCRIPTION - The attribute parameters are the total

number of brokerage trades and account transactions allowed for the account group, the amount of account service fees to be debited, financial planning services and financial reports which the account group holders are eligible to receive, and reduction in credit line interest rate applicable to funds borrowed by holders.

USE - For managing account groups in data processing system of brokerage industry.

ADVANTAGE - Provides access to trading and host of important services without payment of separate transaction charges at the time of eligible transaction.

DESCRIPTION OF DRAWING(S) - The figures show the block diagram of data processing system configuration and interface.

AB- <NV> NOVELTY - A real-time trade activity tool gathers information about orders offered by a party and placed through a trading platform operated by another party, and presents real-time trade information on two primary information screens, an order summary screen (10) and an order details screen. The summary screen displays information, including order information, and the details screen displays information related to a particular mutual fund.|

AB- <BASIC> DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(a) Computer readable medium which stores computer executable instructions that cause a computer to gather real-time information about orders involving commodities offered by a party and placed

through a trading platform operated by another party;

(b) A mainframe system;

(c) A method providing authorization information identifying a third party to another party.

USE - For use in systems where third party fund companies distribute their mutual funds and other products on another company's brokerage trading platform.

ADVANTAGE - The real-time monitoring system can help the third party monitor order activity and identify accounts involving hot money, allowing the third party to take action such as order cancellation or account blockage.

DESCRIPTION OF DRAWING(S) - The figure is a summary screen generated by a real-time trade activity tool.

AB- <PN> WO 200127848 A2|
AB- <NV> NOVELTY - The method for automating trade settlements involves using a host system having a distributed relational database which can be updated by more than one party to a cross-border transaction.|
AB- <BASIC> DETAILED DESCRIPTION - The method for automating trade settlements involves providing a host system or systems with a distributed relational database which is accessible and updated by more than one party to a cross border transaction, and caching a client's standing settlement instructions in a client profile in the distributed relational database. The method further involves **monitoring** messages of a selected **trade** settlement client, and assigning a unique **transaction** identifier of a **trade** settlement for messages that include an execution file or a settlement of a trade. INDEPENDENT CLAIMS are included for; a method for automating corporate action information process; a system for automating cross-border transactions; a method for improving bank-to-bank instructions between financial institutions; a method for centralizing information required to settle a global cross border transaction.
USE - Internet based secure virtual exchange and distributed relational database for cross-border trading of securities.
ADVANTAGE - Reduces number of times a cross-border security transaction is 'touched', and reduces number of failed cross-border security transactions, reduces fees paid by global custodians for cross-border security transactions.
DESCRIPTION OF DRAWING(S) - The drawing shows a schematic diagram showing a relationship between global custodians, sub-custodians, asset managers and broker dealers.

AB- <NV> NOVELTY - The record keeping system (40) aggregates the mutual
fund transactions into omnibus plan trades which is transmitted to
a host processor (50). The transfer agent system (60) executes the
omnibus plan trades. Trade acknowledgment confirmation is done prior to
execution of omnibus plan trades. A mismatch file is generated by the
host processor.|
AB- <BASIC> DETAILED DESCRIPTION - The host processor receives pricing and
other trade information from transfer agent system. Based on the
pricing and other trade information, the host processor evaluates the
omnibus plan trades and produces a trade acknowledgment confirmation
file. The host processor compares trade acknowledgment confirmation and
trade execution confirmation to generate mismatch file which is
transmitted to record keepingsystem. INDEPENDENT CLAIMS are also
included for the following:
(a) an automatic mutual fund transaction processing method;
(b) a network for facilitating the trade processing system.
USE - For executing customer trade transactions in automated trade
processing system.
ADVANTAGE - Position information, trade execution and trade
verification on a daily basis can be provided accurately thereby
achieving efficient access to record keeping data regarding mutual fund
accounts, by providing transfer agent system that confirms trade
acknowledgment prior to execution of omnibus plan trades. Since
execution of omnibus plan trades is carried out later, the ability to
provide trade acknowledgment confirmation back to record keeper prior
to execution confirmation of transfer agent, is enabled. Hence, the
record keeper can begin the process of daily valuation of participant
account even prior to the actual execution of requested trades.
DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of
automated trade processing system.

AB- <BASIC> US 5793301 A

The method involves the construction of an instruction, e.g.
quotation request, order or memo, on a base station, e.g. a pen-type
input computer. The instruction has a
sequence number and a hierarchical number which identifies the
stage of the instruction. The instruction is transmitted to a mobile
station, e.g. a hand-held computer, which adjusts the hierarchical
value and alters the instruction e.g. by stripping some image data. The
altered instruction is sent to the base station signalling receipt of
the instruction.

A further altered instruction is sent to the base station
signalling the user has seen the instruction and the hierarchical value
is again adjusted. Receipt is acknowledged at the base station by
adjusting the hierarchical value and by the re-transmission of the
readjusted instruction to the mobile station.

USE - For transfer of quotes, orders and memos between booth clerk
and floor broker.

ADVANTAGE - Provides assurance that instructions are noticed,
timely processed and faithfully followed. Provides audit trail for
reconciling unreconciled trades. Allows monitoring of broker
activity.

The processing system provides an interface with a securities exchange system over which securities are traded. The system allows a user to configure displays (3000) tailored for specific functions and to show displays (3050) for a particular security. The user may also view a display showing information about selected securities (3034), monitor trade activity, participate in a trade and report

trades .

A user may display information for a selected set of securities on a continuously updated basis (3035) and can easily select from a displayed list, a desired security and certain information and functions associated with the selected security.

USE - Customising displays showing information about securities exchange system.

The system includes a **record** keeper for receiving participant mutual fund **transaction** requests, aggregating the participant mutual fund **transaction** requests into omnibus plan **trade** files and transmitting the omnibus plan **trade** files. A host processor interacts with the **record** keeper device and receives the omnibus plan trade files.

The host processor also verifies at least one of the number of fields of information, processes the omnibus plan trades, and **trade** -acknowledgment confirms the omnibus plan **trades** to the **record** keeper device. A **transaction** execution device, interacts with the host processor device, executes the omnibus plan **trades**, where trade-acknowledgment confirmation occurs at a time prior to execution of the omnibus plan trades by the transaction execution device.

ADVANTAGE - Provides reliable and efficient access to record keeping data. Provide automatic access to record keeping data with minimum human intervention. Accurately provides trade execution and trade verification on a daily basis.

Each registrant is assigned a unique registration number, which is printed in bar-coded form on an identification badge, which also includes the name and professional affiliation of the attendee. Registration information, including the name, address, business affiliation and registration number of the attendee, is permanently stored in a central data base. Each booth or exhibit at the trade show or convention is equipped with an information storage device for recording the visits of individual attendees.

The information storage device includes a bar-code decoder for reading the bar-coded registration number from the attendee's identification badge and from a bar-coded menu of information requests and for storing the information along with a record of the time of day and the date of the visit. At the end of the day or at the end of the trade show or convention, the stored information may be transferred by cable or telecommunications link to a main data base, where the information is processed along with the registration information.

USE/ADVANTAGE - Provides selected compilations of data relating to attendees and their activities at trade show or convention.

The system includes a cash card having machine sensitive information recorded, including information representing an available cash balance in an account of the bearer, and a randomly mutated enciphering key. A transaction register machine at the location of trade sale includes a device for receiving the cash card from the bearer and recording information to and reading information from the cash card. The enciphering key randomly generated and recorded key on the cash card with a random mutation by recording with no a.c. or d.c. bias and no saturation.

Personal identification number (PIN) data is received from bearer independent of the cash card, the PIN data constituting a further enciphering key. Data is enciphered and deciphered card using the two enciphering keys. The validity of the cash card is verified by determining whether the received PIN data successfully deciphers information previously enciphered and recorded onto the card.

ADVANTAGE - Provides high security.

AB- <EP> EP 237815 B

An electronic fund transfer system for handling a card bearer's fund transfer transaction in a trade sale comprising: a cash card (100) having machine sensitive information recorded thereon, including information representing an available cash balance in an account of the bearer, and a first enciphering key; and a transaction register machine at the location of trade sale including means for receiving said cash card from said bearer and recording information to and reading information from said cash card, means for randomly generating said first enciphering key and recording said first enciphering key on said cash card as an analog signal with a random mutation by magnetic recording with no a.c. or d.c. bias and no saturation, means for receiving personal identification number (PIN) data from said bearer independent of said cash card, said PIN data constituting a second enciphering key, means for enciphering and deciphering data to be recorded on and read from said cash card using said first and second enciphering keys, means for verifying that the bearer of said cash card is an authorised card bearer by determining whether said received PIN data successfully deciphers information previously enciphered and recorded onto the card, means for modifying said available cash balance and other information recorded on said cash card in accordance with said **transaction**, and means for magnetically **recording** and storing information of the **trade sale cash transaction** for later processing.

AB- PROBLEM TO BE SOLVED: To provide a transaction managing system with
secured safety for mediating commercial transaction through the
Internet. SOLUTION: This system, when receiving order information
from a user, takes a customer transaction number specific to the
order, and generates readable first **transaction** managing web
information sequentially **recording trade** information of order
confirmation for every customer **transaction** number, **transaction**
content process confirmation, receipt confirmation, and return
report. This system, when receiving order confirmation information
from the user, generates readable second transaction managing web
information sequentially recording information of order confirmation
for every customer transaction number, shipping schedule, shipping
record, return confirmation, and reshipping record. COPYRIGHT:

AB- PROBLEM TO BE SOLVED: To conduct trade transactions which reflect real
society during a game and to reflect the trade transaction behavior
on the progress content/ virtual space of the game. SOLUTION: A game
trade transaction integrated program is fetched into a computer, and
the game is conducted. A virtual shop exists in the game. In the
virtual shop, a commodity that the electronic trade transaction
system on a network supplies is displayed. Came reflection data
changing a game content is given to respective commodities. When a
game player inputs will to purchase the commodity, the program puts

Search Report from Ginger D. Roberts

in orders for the commodity to the electronic trade transaction system. When the settlement of the commodity is conducted appropriately, the electronic trade transaction system delivers (distributes) the commodity, and game reflection data given to the commodity is transferred to the game trade transaction integrated program. The program changed the game content according to the data received. COPYRIGHT: (C)2001,JPO

AB- <NV> NOVELTY - The system has a central unit(s) and at least one distributed unit that can **exchange information** contactlessly via transmitters and receivers. The distributed unit has at least one **input** filter in its receiver. The central unit normally transmits pulses at defined times that are distributed in spectrally broadband manner. The distributed unit receives the pulses with a broadband **detector** and **detects** state **changes** using an agreed schema.|

AB- <BASIC> DETAILED DESCRIPTION - The system has at least one central unit and at least one distributed unit, e.g. a motion sensor, which can exchange information contactlessly via transmitters and receivers in each unit. The distributed unit has at least one input filter (F1) in its receiver and a broadband detector (BD1). The central unit normally transmits pulses at defined times that are distributed in spectrally broadband manner. The distributed unit receives the pulse with the broadband **detector** and **detects** state **changes** by comparison using a schema agreed with the central unit.

USE - Alarm systems, warning systems or other state-controlled radio systems.

ADVANTAGE - The auxiliary channel is implemented in a particularly energy efficient, spectrum efficient and inexpensive manner.

DESCRIPTION OF DRAWING(S) - The drawing shows a schematic representation of a wireless alarm system receiver (Drawing includes non-English text)

AB- <PN> KR 2001000783 A|

AB- <NV> NOVELTY - A job offering auction system and method is provided to perform a job seeking or a worker hiring auction among job seekers and job offerers and give them milage points according to the satisfaction degree of the job seekers and the job offerers.|

AB- <BASIC> DETAILED DESCRIPTION - A job offering auction system comprises a communication control module(102), a data input module(104), a job offerer profile database (106), a job seeker profile database (108), an auction database (110), a milage management database (112), a web document editor (114), an auction execution algorithm(116) and a control module(120). The communication control module(102) performs a signal I/O and a protocol matching with respect to a data communication network. The job offerer profile database (106) stores a set of company data such as a business category, a registration number, a revenue or a profit, and a set of worker requirement conditions such as a work category, a pay, a work term or other work condition. The job seeker profile database (108) stores a personal profile data and seeking work related conditions. The control module(120) receives the data from the job seekers and offerers, stores the data at the databases (106,108), and performs the auction among them by controlling the auction execution algorithm(116).

 AB- <NV> NOVELTY - Sensors (40) monitor data related to variables selected
 from the group consisting of electrical, magnetic, mechanical, fluid
 flow, chemical and thermal properties in implant (10) or implant's
 environment, in a patient. Monitoring devices (50,30) and actuating
 devices (20) implement response to data in the implant device (10).|
 AB- <BASIC> DETAILED DESCRIPTION - The system has a **data storage** device
 on the device (10) or contiguous to the device or within or on the body
 of patient. The system includes a telemetry device and a device for
 communication to one of a series of tested groups of **information**
exchange. An external **input** is connected through loops to effectuate
 change in the device from an actuator (20). Monitoring devices (50,30)
 are placed external to patient. A sensor (40) **detects the changes**
 in pH, temperature, ion concentration or analyte concentration. The
 actuator modifies the shape or position of implant (10) in response to
 signal from the sensor. The device includes a bioactive, diagnostic or
 prophylactic agent or pH modifying agent, which is released into
 environment. An INDEPENDENT CLAIM is also included for usage method of
 implant.
 USE - In implants such as endoluminal stents, stent-grafts, grafts,
 rings, hooks, sutures, wires, tissue conduits that are implanted in
 arteries, veins, venous fistulas, bile ducts, ureter, fallopian tubes,
 artificial spaces created surgically for radiology, gastroenterology,
 urology, cardiology and other fields of surgery.
 ADVANTAGE - Enables alteration of local environment or local or
 distant therapy based on data sensed by sensor.
 DESCRIPTION OF DRAWING(S) - The figure shows the flow diagram of
 implant connected to sensor and transponder.

AB- <NV> NOVELTY - Peripheral computer which does not have operating system, executes communication program to transmit data from user input computer and to display graphics data received from control computer (12) which is spatially removed from it and which has memory with utility program (62). Utility program is virtually executed remotely from peripheral computer having insufficient processing capability to run program.|

AB- <BASIC> DETAILED DESCRIPTION - The control computer has a separate bus structure and **exchanges data** with the peripheral computer and an **input** -output module which provides electrical connections with a controlled process. The memory in the control computer has an operating system providing an interface between the control computer and only programs executed on the control computer. The memory holds a control data including input and output data exchanged through the input-output module and includes control program for processing input and output data when executed by the processor under the operating system.

The memory holds utility program executed on a stand alone computer running the operating system and reads the control data to produce a graphic representation of control data on graphics display in response to input from user input device. A shell program (64) executed by the processor of the control computer, simulates the stand-alone computer to execute the utility program by receiving data from user input device of peripheral computer and transmitting graphics data to the graphics display of peripheral computer.

USE - Industrial control system employing utility programs such as graphical **editors** and display programs in soft programmable **logic** control systems, for real-time processing.

ADVANTAGE - Allows utility programs to be executed on peripheral computers having insufficient computing resources to support operating system. Eliminates the need for peripheral computer to support the operating system necessary to run the utilities. Centralizes the **data storage** requirements for improving performance and simplifying protection of critical data at a single location of control computer.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of control computer.

 NOVELTY - Registered name of a **disc** (1) is stored as an edit information. The name is entered through a character information input device. If the **disc** is not loaded during name entering, the entered name is stored in **edit** area. A **disc** detecting unit (30) detects insertion or removal condition of the **disc**. The edit **data** stored in edit area is updated depending on **disc exchange** or **insertion** of

new **disc** . DETAILED DESCRIPTION - Edit **information** of correctly loaded **disc** and the data input by character information input device are stored in separate memory. Updating process is performed depending on detection result of **disc** detecting unit after completion of character information input operation.

USE - For recording and reproducing apparatus e.g. mini- **disc** system.

ADVANTAGE - Since character information about desired **disc** can be made to record automatically, frequency of key operation is reduced. Possibility for misoperation of character information updating process is reduced hence improving user's versatility. DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the recording and reproducing apparatus. (1) **Disc** ; (30) **Disc** detecting unit.

TI- Man day collection method of notebook type data processor e.g.
electronic notebook for several industries - by accumulating all man
day inputs through touch type input unit from all notebook data
processors assigned to each type of industries, by computer|

PA- KAJIMA CORP (KAJI)|

NC- 001|

NP- 001|

PN- JP 9044528 A 19970214 JP 95195557 A 19950731 199717 B|

AN- <LOCAL> JP 95195557 A 19950731|

AN- <PR> JP 95195557 A 19950731|

FD- JP 9044528 A G06F-017/40|

LA- JP 9044528(11)|

AB- <BASIC> JP 9044528 A

The method involves **editing** the man day **report** that contains the production table of a work place to each type of industry by a computer. A notebook **data** processor that includes a fixed panel, a memory, a touch type **input** unit, and a display is assigned to each type of industry. **Data exchange** is performed between the computer and each notebook data processor.

The report and the table are posted to the memory of each type of industry from the computer. The man day of each type of industry is input to the notebook data processor through the touch type input unit. The input man day is posted from the processor to the computer. All input man day of the processors are accumulated by the computer.

ADVANTAGE - Reduces human error and sharply improves precision of man day collection. Quickly performs retouch and enables input error to be corrected since input error is detected automatically. Saves labour cost since skilled expert is not required during input of manual work to computer and because input through touch type input unit is performed without key operation. Performs man day collection at high speed since working situation and step charge are grasped immediately.

LA- JP 7234869(11)|
AB- <BASIC> JP 7234869 A

The sentence processing device (1) has an **input** unit for a character and control **information**. The area **information** which **exchanges** the character information comprising a sentence, is stored by a sentence memory unit (5). The ornamentation information on a character unit and the character size information on a character are also stored by the sentence memory unit.

Another memory unit attaches an attribute data to each character data comprising **document** information. The processing unit **changes** the character size information of the character data stored in the memory unit according to the character or control information input by the input unit. As a result, the sentence is settled in optimum character size in the specified area.

ADVANTAGE - Prints sentence of free layout briefly. Makes sentence highly legible. Simplifies operation. Eliminates need for specifying attribute again during edit operation.

 AB- <BASIC> SU 1249514 A

Initially the device is in its first state, with logic '0' in flipflops (1,2) and logic '1' in flipflops (3,4). A logic '1' on the inverting output of flip flop (2) allows a search of the peripheral equipment for any possible interruption and any request for time appears on input (20). Input (19) receives the permission for this and flip flop (1) switches over, giving a signal indicating an interruption to the computer, and changing flip flop (2) to logic '1' state. A signal from the last goes to output (28) and the device is now in its second state. Until a clock pulse arrives on **input** (26), strobing the **data exchange**, this continues.

If, before this or during this, a signal erasing the interruption arrives, flip flop (1) goes into logic '0' state, and when the data transmission ends logic '1' is passed to input (22) and flip flop (1) **changes to logic '1'** state, synchronising the exchange of the states of flipflops (2,3,4). The first inputs of AND-gate (16), NAND-gate (8,9,11,12) receive a '0' and the inputs of the EXCLUSIVE-OR-gate (18) logic '1', so that at a synchrosignal the data on the inputs is recorded in flipflops (2,3,4). The device is now in its third state. Due to the signals on inputs (19,20), data from the computer is passed to the device and signal from the inverting output of flip flop (2) and the direct output of flip flop (3) open AND-gate (17) through AND-gate (16), recording the control data in register (5). The device is now in its fourth state and more data goes to the computer. In the fifth the results are passed to the peripheral equipment and the sixth and seventh return the device to its initial state.

USE/ADVANTAGE - This innovation concerns electronics and computing systems and is suitable for use in data exchange and processing systems. The advantage is an ordered interruption of the **main frame**. Bul.29/7.8.86.

 AB- <BASIC> WO 8700154 A

The container is in the form of a canister (10) which stores currency notes (30) or other documents such as traveller's cheques to be dispensed. The buttons (25) are of resilient material and are arranged to project, each through a respective hole formed in a face plate, from the canister. A respective boss at the base of the button prevents it from passing completely through the face plate from the inside of the canister. Each canister in an automatic teller machine cooperates with a respective picker mechanism which includes a canister mounting plate (103) and a roller (102) mounted on a shaft (106).

The roller incorporates high-friction rubber parts (112) for pulling notes off the stack (30) in the canister. The arrangement of buttons represents information about location, ownership and serial number of each canister, the type and denomination of notes in the canister and **changes** in the status of **documents** in the canister. Each button acts with a respective actuator (128) and electrical switch (130) to provide the information in the form of electrical signals for input to a computer.

ADVANTAGE - Document canister is labelled reliably and permanently in machine-readable form with information representing ownership and contents of the canister.

Dwg. 9/13|

AB- <EP> EP 600848 B

Apparatus for dispensing documents, including at least one removable container (10) for holding a supply of documents (30) and a machine associated with said container, said apparatus comprising:

a housing (101) of said machine, said container (10) mounted on said housing during operating of the apparatus;

a picker mechanism (100) mounted on said housing in operative connection with said container for removing documents from the supply for dispense;

a plurality of information indicating means (25, 26) associated with said container;

a plurality of sensing means (12) associated with said machine; and control means (130) in operative connection with said sensing means

controlling the picker mechanism (100), the said indicating means (25, 26) being selectable between a first condition and a second condition, an arrangement of said conditions representing a characteristic of said documents, and being changeable to produce different arrangements representing different characteristics of said documents, characterised in that the said control means (130) adjust how the picker mechanism (100) operates in accordance with the characteristic represented by the selected arrangement of the indicating means.

Dwg.1/12

EP 459529 B

A method for recording picking failures when documents (30) are picked from an interchangeable container (10) by a dispensing apparatus which comprises sensing means to detect when a picking failure from the container occurs the method comprising generating signals representative of the occurrence of the picking failure and transmitting electrically said signals from said dispensing apparatus to a recording station, said recording station recording the occurrence of the picking failure, characterised in that the method is applied to a system having a plurality of containers (10) each of these containers being labelled with a data item, in that there are reading means for reading these data items, in that signals representative of these data items are generated, and in that said data items are represented by a plurality of machine readable information indicting means comprising uniformly sized holes (26) in said containers (10) adapted to receive spring-loaded protuberance (25) movably mounted therein and selectable between a first condition and a second condition.

Dwg.1/13

EP 399570 B

A System of labelling containers, comprising a plurality of information indicating means (25, 26) associated with said container (10), said indicating means being selectable between a first condition and a second condition, and verification means to verify the correct receipt of data represented by an arrangement of said information indicating means, characterized in that said plurality of information indicating means is divided in at least two subsets (136, 146, 148, 154, 158), arrangements of said conditions in said subsets representing data, and in that the data represented by the arrangement in at least one first subset is useable as verification means to verify the correct receipt of data represented by the arrangement in at least one second subset.

Dwg.11/16

EP 227793 B

Apparatus for dispensing documents, including at least one removable container (10) for holding a supply of documents (30) and a machine associated with said container, said apparatus comprising: a housing (101) of said machine, said container (10) mounted on said housing during operation of the apparatus; a picker mechanism (100) mounted on said housing in operative connection with said container for removing documents from the supply for dispense; a plurality of information indicating means associated with said container, said means being selectable between a first condition and a second condition, an arrangement of said conditions representing a characteristic of said documents; a plurality of means (128) associated with said machine for sensing the state of the indicating means; and control means (130) in operative connection with said sensing means controlling the picker mechanism (100) according to said characteristics; characterised in that the said information indicating means comprises a plurality of holes (26) adapted to receive buttons (25) therein and spring-loaded buttons (25) therein and spring-loaded buttons (25) selectively slidably mounted in said holes (26), in that said first condition is the presence and said second condition is the absence of a button extending from a hole, in that the sensing means comprise actuators (128) associated with electrical switches (30), each actuator (128)

being, in an operating position, in alignment with a respective hole (6) so as to contact the spring-loaded buttons (25) extending therefrom when present, and in that the arrangement of the buttons (25) in the holes (26) is changeable according to different characteristics of said documents.

Dwg.9/16|

AB- <US> US 5141127 A

The system comprises a device for labelling each container with a unique serial number which is machine readable. A reader in the appts. obtains the serial number and generates representative signals. A sensor detects when a picking failure associated with the container occurs. A signal generator provides signals representing the occurrence of the picking failure from the container.

The serial number labelled on the container is a binary digit. The binary digit is represented by a number of holes in the container. A binary one is represented by a protuberance extending from the hole. A binary zero is represented by the absence of a protuberance. The sensors are presence detectors adjacent the holes.

ADVANTAGE - Labelling information is tamper resistant but readily changed by authorised personnel. (Dwg.8/16)

US 5099423 A

A canister (10) holds a stack of documents (30) and has a face plate (24). The face plate (24) includes buttonholes (26). Spring loaded buttons (25) are distributed among buttonholes (26), the buttons (25) are distributed among buttonholes (26), the arrangement of the buttons representing items of data such as ownership of the canister, canister serial number, and document information such as the type, denomination, amount, and character of the documents in the canister.

When inserted in the ATM, the canister **exchanges** identifying information with the ATM via the arrangement of buttons. A computer, which controls the operation of the ATM, uses this information to do such things as adjust the operation of the ATM to conform to the type, denomination and character of the documents in each canister, settle accounts between entities who supply the documents to the ATM, track the location of each canister, determine serial numbers of canisters involved in dispense failures, and signal when the documents in a canister need to be replenished.

USE - For identifying and indicating the content of document canisters such as those used to hold supplies of documents in Automatic Teller Machines (ATMs). (19pp)

US 4871085 A

The appts. for identifying and indicating the content of document canisters such as those used to hold supplies of documents in Automated Teller Machines (ATMs). includes a canister (10) holding a stack of documents (30) and having a face plate (24). Face plate (24) includes buttonholes (26). Spring loaded buttons (25) are distributed among buttonholes (26); the arrangement of the buttons representing items of data such as ownership of the canister, canister serial number, and document information such as the type, denomination, amount, and character of the documents in the canister. In operating position, canister (10) is located in at ATM in contact with the picker mechanism which removes documents, one at a time from the canister.

The picker mechanism incorporates a switch plate which is adjacent to face plate (24) when canister (10) and picker mechanism are in operating position. Switch plate incorporates a plurality of switch actuators, the locations of which correspond to the locations of buttonholes (26). Each switch actuator is associated with an electrical switch which changes its electrical condition whenever its associated switch actuator is depressed. Electrical switches are connected to a computer which controls the operation of the ATM, as well as stores and processes data relating to ATM operation. The computer is programmed to associate the arrangement of buttons with the items of data represented by the arrangement. (19pp)c|

AB- <BASIC> SU 860044 B

Multiplex channel contg. a central processor interface (1), control register (4), call address **modifier** (5) and interface **monitor** (9) has greater operating efficiency for use in input-output channels of digital computing machines, esp. control computers in e.g. aerial interrogation of sensors or subscribers.

A third output of the central operative memory interface (2) is connected to a third **input** of the subchannel register (3). Productivity of the **data - exchange** system is increased as a whole since the processor is less engaged in triggering a number of sensors.

If a peripheral is ready to receive or transmit data, its claim is presented to the channel which determines the address of the claimant peripheral and records it in the subchannel register via the peripherals interface (8). Accordingly, the control (4) and data (6) registers receive subchannel control data and a data word from the local memory (7) for data-exchange with the peripheral. Bul.32/30.8.81

Proposed is a decadic digit receiver for use in a telecommunications switching system, the receiver serving several exchange lines each carrying decadic digit signals. The receiver includes (1) a multi-zone recirculating shift register each zone including binary **information** relevant to decadic digit signals detected on a particular **exchange** line, (11) a **scanner** for monitoring the **exchange** line and providing a time shared output in synchronism with the recirculation of the information in the multi-zone shift register, (111) shift register control logic to which the time-shaped output is supplied together with the recirculating shift register information. The control **logic** is arranged to **modify** the recirculated information in accordance with its previous setting and the state of the decadic digit signals on the particular exchange line.

KW- R107 (INFORMATION PROCESSING -- OCR & OMR Optical Readers)

SO- Section: E, Section No. 1418, Vol. 17, No. 456, Pg. 155, August 20,
1993 (19930820)

AB- PURPOSE: To improve efficiency and reliability for a **monitoring**
mechanism by providing an OMR **edition** /reading part of each device
with a code conversion mechanism and making a detail format by
utilizing a code of the OMR form.

CONSTITUTION: A transmission information memory 45 stores a
transmission surface in the scanned state as a FAX signal, and a
signal hybrid part 44 hybridizes output information to a display part
and memory information at the time of the occurrence of a fault and
outputs it as transmission information. A transmission and judgment
part 43 has the dial information on a designated FAX, performs a
transmission, and at the same time, judges the importance degree
information on transfer information and performs judgment on a
regulation on a FAX transfer or a public network transmission. An OMR
edition/reading part 42 converts various information by an exclusive
protocol to be used for the access from the conventional terminal and
for **information exchange** inside the device into a FAX signal
format and converts the **information inputted** as the FAX signal
into an exclusive protocol. Thus, fault information which is
collected is made into FAX signal and is transferred.

 AB- <NV> NOVELTY - A storage memory stores the processed data which is transmitted in a secure environment between various remote locations, using encryption and decryption software. A broker representative software is installed to respective computers which creates trade record and performs reviewing, approving and disapproving of the trade record. A trade audit security measure is provided, such that only authorized user accesses and uses the trade data.|
 AB- <BASIC> DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:
 (a) Broker transaction data processing and management method;
 (b) Broker transaction data processing and monitoring method
 USE - For managing broker transaction information such as client profiles, stock broker transactions, etc.; used by broker/dealer representatives, local brokerage offices and government regulators.
 ADVANTAGE - Prevents unauthorized trade activities by allowing secure input, data transfer and storage of a wide array of information, thus eliminating the need for paper logs. Enables efficient and comprehensive inspections by creation of standard reports which are instantaneously accessed. Handles electronic mail communication involving broker transactions and provides simple and low cost, less time consuming processing of data between remote locations. Ensures additional security features by providing trade audit functions which prevents unauthorized trade record change.
 DESCRIPTION OF DRAWING(S) - The figure shows the flow diagram illustrating process of recording trade information in the main server database.

English Abstract

A computerized order entry, routing and reporting system for receiving and routing an order is disclosed. The system is coupled to a number of electronic trading systems. A control engine is coupled to the electronic trading systems. A user workstation is coupled to the control engine. The user workstation includes a screen display. The user workstation receives an order and electronically transmits the order to the control engine. The user workstation can also display order information on the screen display. The control engine, upon receipt of the order from the user workstation, automatically and electronically routes the order to one of the electronic trading systems, and electronically receives the execution information concerning the order from that electronic trading systems. The control engine automatically correlates the execution information with the order information and electronically transmits the execution information to the user workstation. The user workstation displays the execution information correlated with the display order information.

French Abstract

L'invention concerne un systeme informatique d'entree, d'acheminement et de rapport d'ordres. Le systeme est couple a plusieurs dispositifs de transactions electroniques. Un module de commande est accouple aux dispositifs de transactions electroniques. Un poste de travail utilisateur est accouple au module de commande. Le poste de travail utilisateur comporte un affichage a ecran. Le poste de travail utilisateur recoit un ordre et le transmet electroniquement au module de commande. Il peut egalement afficher sur l'ecran des informations d'ordres. Le module de comande, a reception de l'ordre provenant du poste de travail utilisateur, achemine l'ordre automatiquement et electroniquement vers un des systemes de transactions electroniques et recoit electroniquement l'information d'execution concernant l'ordre depuis lesdits systemes de transactions electroniques. Le module de commande met automatiquement en correlation l'information d'execution avec l'information d'ordre et transmet electroniquement l'information d'execution a la station de travail utilisateur. Celle-ci affiche l'information d'execution mise en correlation avec l'information d'ordre affichee.

English Abstract

An automated apparatus for monitoring chemical reaction assays which includes a supply system (15, 17) for providing accurately metered solutions of reactants to a mixing chamber (19). The mixing chamber (19) is connected to a reaction chamber (21) wherein a substantial portion of the reaction between the reactants occur. A physical parameter, which is a function of the concentration of at least one of the reactants and reaction products, is measured in reaction chamber (21). A computer (35 and 39) is used to automatically control the supply system, mixing chamber and reaction chamber and to analyze the data obtained from the reaction chamber (21) to determine kinetic constants and other parameters associated with the assay.

French Abstract

Dispositif automatise pour le controle d'analyses par reaction chimique, comprenant un systeme d'alimentation (15, 17) introduisant des solutions de reactifs dosees avec precision dans une chambre de melange (19). La chambre de melange (19) est reliee a une chambre de reaction (21) dans laquelle se produit une partie considerable de la reaction entre les reactifs. Un parametre physique, qui est une fonction de la concentration d'au moins un des reactifs et des produits de reaction, est mesure dans la chambre de reaction (21). Un ordinateur (35 et 39) est utilise pour commander automatiquement le systeme d'alimentation, la chambre de melange et la chambre de reaction et pour analyser les donnees provenant de la chambre de reaction (21) afin de determiner les constantes cinetiques et d'autres parametres associes a l'analyse.
